

CAMP

Cardiopulmonary Awareness
Management Program

What is CAMP?

CAMP improves quality of life and reduces hospitalization for patients by incorporating early intervention, daily vital signs monitoring and health coaching with proven techniques used by clinicians across the country.

American Heart Association estimates by 2030 over 8 million people will suffer from a heart related illness. Axiom Cares CAMP program has been proven to educate our patients and prepare them to remain compliant after the home care with Axiom has ended. This allows patients to remain free of unnecessary hospitalizations and enjoy their lives.

Common heart related hospitalizations are due to:

- Improper diet
- Medication error
- No post-acute care after discharge
- No one following up, to ensure compliance

30-Day Readmission Rate for Patients

How CAMP Works

Early Intervention

- Start of care with-in 24 hours of discharge.
- Follow up with primary care physician and cardiologist.
- Ensure follow up visit is scheduled for patient.
- Set standing orders for medication and nursing visits, should patient conditions deteriorate.
- Front-loading nurse visits to identify concerns early-on.
- Provide patient with digital weight scale, digital blood pressure cuff, digital pulse oximeter.

Daily Check-Ins

A nurse calls daily from the Axiom team to monitor;

- Weight
- Blood pressure
- Pulse
- Oxygen level
- Other factors that help determine if patient needs medical attention.

Life Long Changes

- Our staff educates and helps the patient and family understand long term behavior modifications such as diet, exercise and medication compliance.
- Signs and symptoms to watch for and what action is necessary to stabilize the patient's condition.

Post Discharge Support

- A nurse will continue to call every other day for 30 days after discharge to ensure patient is still following the new practices implemented.
- Patient keeps equipment for life to ensure they have tools to remain successful.
